Dear Mr. Hingtgen:

Please accept the following comments and opinions regarding the Draft Programmatic Environmental Impact Report ("DPEIR") issued by the County of San Diego (the "County") for the Soitec Solar Development Project at the Rugged, Tierra del Sol, LanEast, and LanWest locations (the "Project"). They are submitted pursuant to the California Environmental Quality Act ("CEQA"), Public Resources Code ("PRC") section 21000 et seq., on behalf of the Protect Our Communities Foundation, Backcountry Against Dumps and Donna Tisdale (collectively "Conservation Groups"). These comments and opinions should be considered in conjunction with those submitted by Mr. Steven C. Volker on March 1, 2014 also on behalf of the Protect Our Communities Foundation, Backcountry Against Dumps and Donna Tisdale. They include support for Mr. Volker's concerns and also identify issues not addressed in Mr. Volker's submittal.

QUALIFICATIONS

I am the Owner and Principal Consultant for E-Coustic Solutions, of Okemos, Michigan (P.O. Box 1129, Okemos MI 48805). I have been a practicing acoustical engineer for 40 years. I have been actively involved with the Institute of Noise Control Engineers (INCE) since I started my career in the early 1970s and have Full Member status in the Institute. My clients include many large manufacturing firms, such as, General Motors, Ford, Goodyear Tire & Rubber, and others who have operations involving both community noise and worker noise exposure. In addition, I have worked for many small companies and private individuals. My academic credentials include appointments as Adjunct Professor and Instructor to the Speech and Communication Science Departments at Michigan State University and Central Michigan University. I have previously submitted reviews of EIS documents for several renewable energy projects in California including: Ocotillo Wind Energy Facility, Avalon Wind Energy Project, East County Substation/Tule Wind/Energia Sierra Juarez Gen-Tie Projects, and the Shul'Lauk Wind Project.

DEFICIENCIES IN DOCUMENTS DESCRIBING NOISE IMPACT FROM THE PROJECT

DEFICIENCY 1-INADEQUATE INFORMATION TO PROPERLY CHARACTERIZE NOISE IMPACT ON ADJACENT PROPERTIES

The documentation for the Project's Noise Impact provided in the Soitec Solar Development Program EIR (Jan. 2014) Section 2.6 and referenced documents:

- Acoustical Assessment Report, Tierra del Sol Solar Farm Project (Appendix 2.6-1), and
- Rugged Solar LLC Project, Noise Impact Analysis Report (Appendix 2.6-2),

O21-2 This comment is introductory in nature and does not raise a significant environmental issue for which a response is required. Specific comments on the Proposed Project are addressed below.

O21-3 This comment does not raise specific issues related to the Proposed Project or adequacy of the environmental analysis in the Draft Program Environmental Impact Report (DPEIR); therefore, no additional response is required. However, the County appreciates you providing your credentials and identifying your experience with large energy project noise issues. It appears the commenter's experience has focused largely on wind energy projects, for which low frequency noise is an important issue.

The A-weighted decibel (dBA) metric was created as a standardized and simplified method for communicating noise effects to a broad audience including both technical and non-technical participants. While frequency spectrum and tonal quality further describe noise characteristics, the County of San Diego (County) has adopted California Environmental Quality Act (CEQA) significance thresholds and noise ordinances that use dBA as the specified parameter for the noise sources related to the proposed project. The noise analysis therefore employed an appropriate metric for comparison of project effects against adopted standards. In addition, the DPEIR explicitly addresses impacts related to

SUBJECT: COMMENTS ON SOITEC SOLAR DEVELOPMENT DPEIR

describe operational and construction related noise sources that have complex noise emissions. The Soitec EIR and references provide only the most limited information about the sounds that will be produced by this equipment. Only sound levels and sound power levels expressed as dBA values are provided without any scientific consideration of the frequency spectrum, impulsive characteristics, tones, or other characteristics that are not addressed in a dBA metric yet are important to any evaluation of the noise impact of the operation. Yet, many of the noise sources are described in the narrative as being impulsive, tones, and other characteristics that were then ignored by an analysis that only considered long term averages (CNEL) and dBA levels. Without detailed frequency and amplitude data for each noise source it is not possible to determine if the Project, either in operational or construction modes, may produce excessive infra and low frequency sounds that are also associated with annoyance and community complaints.

The result is that the project analysis presented in the Soitee EIR fails to address the most likely causes of future noise complaints. Further, the failure to include this information precludes this more detailed analysis by independent peer reviewers. The result of excluding this sesential and necessary additional information both for other reviewers and for the EIR itself is that the conclusion that the project will be compatible with existing land use is based only on a partial, inadequate review and analysis.

For a project with the type of noise sources identified in the EIR the analysis requires octave band or 1/3 octave band details of sound power emissions and sound pressure levels for each of the construction and operational noise sources identified in the EIR. In addition, for any noise source that produces impulsive sound, (pile drivers, jack hammers, etc.) the average sound levels are meaningless since it is the peak sound pressure levels that would relate to annoyance and land use compatibility. For these types of noise sources the number of impulses and the number of emitters that produce them is essential to a full and complete analysis.

Failure to include this information results in an EIR that distorts the analysis and conclusions that may be drawn from the documents. It precludes a full and accurate analysis of the Project's noise impact and identification of alternatives or mitigation measures. It also precludes a full and independent review.

DEFICIENCY 2-CNEL ANALYSIS IN EIR DOES NOT ACCOUNT FOR TONES AND IMPULSES

As stated above there is clear information in the EIR that some of the noise sources have tonal and/or impulsive characteristics. Proper application of the CNEL method requires that these characteristics be included in the calculations of the CNEL as a 5 dB penalty. See attachment to this document "CNEL Calculation and Normalization Methods" for these adjustments. The 5 dB adjustment for pure tones and impulses is found at the bottom of the table.

Review of the Dec. 2013 Acoustical Assessment Report by Dudek (Soitee EIR Appendix 2.6-1 and 2.6-2) finds no consideration given to the special characteristics of tones and impulses required by the CNEL method. An excerpt from the table in Appendix B-CNEL Calculation of Operational Noise Levels at NSLUS (Worst Case) found in Appendix 2.6-2 is provided in Figure 1. Under the column labeled "Adjustment" we see only adjustments for the time of day: 10 dB for nighttime operations, and 5 dBA for evening operations. This analysis is deficient because it does not address the noise source's characteristics as required for CNEL analysis.

Figure 1-Excerpt from Appendix 2.6-2 CNEL Table

impulsive noise, vibration, corona noise, and low frequency noise in DPEIR Sections 2.6.3.2, 2.6.3.3, 2.6.3.4, and 2.6.7. Where appropriate, the County has provided mitigation measures or project design features to address potential impacts (see PDF-N-2, M-N-TDS-4, M-N-LE-1, M-N-LW-1).

The analysis of Proposed Project impacts follows the adopted County guidelines for noise assessment. The conclusions are represented using metrics appropriate for comparison to adopted significance thresholds and ordinance standards. Refer to response O21-4 above describing the A-weighting scale as an acceptable metric.

O21-6 The adopted County guidelines for noise assessment do not require noise generation to be evaluated on an octave band or 1/3 octave band basis. These spectral analyses are not necessary for environmental or community noise assessment, and are typically reserved for applications such as architectural noise control.

The DPEIR analysis of impulsive noise impacts follows the adopted County guidelines for noise assessment section and is consistent with County Noise Ordinance standards. See DPEIR Section 2.6.3.2. During construction and prior to any blasting activities that may be required, a blasting plan prior to construction would be required to demonstrate any impulsive noise impacts and vibration impacts are in

compliance with County standards.

O21-8 The noise analysis follows, and includes all the prescribed content from, the adopted County guidelines for noise assessment. We disagree that the analysis is deficient, in light of the fact that it complies with the requirements in the County guidelines for noise assessment.

O21-9 The County guidelines for noise assessment do not incorporate the correction methodology prescribed by the referenced U.S. Environmental Protection Agency (EPA) document (NTID300.3, Community Noise, 1971). The calculation of community noise equivalent level (CNEL) values in the DPEIR is consistent with the County guidelines for noise assessment and the Noise Element of the County of San Diego General Plan that establish limitations on CNEL sound levels to be received by noise sensitive land uses. According to County of San Diego Guidelines for Determining Significance – Noise (2009), the method for calculating CNEL is as follows:

1.1.4 Community Noise Equivalent Level (CNEL)

This term applies weights to noise during evening and nighttime hours to compensate for the increased sensitivity of people to noise at those times. CNEL is the equivalent sound level for a 24-hour period with a +5 dB weighting applied to all sound occurring between 7:00

			p.m. and 10:00 p.m. and a +10 dB weighting applied to
			all sound occurring between 10:00 p.m. and 7:00 a.m.
Countie Solutions Page 3			CNEL is expressed in the A-weighting frequency scale.
Subject: Comments on Soitec Solar Development DPEIR MARCH 3, 2014			
DEFICIENCY 3-CNEL ANALYSIS IN EIR DOES NOT ACCOUNT FOR CORRECTIONS FOR OUTDOOR RESIDUAL LEVEL	Ţ		In the case of airport or aircraft noise, CNEL is often
The CNEL method also requires an adjustment for the character of the community's soundscape prior to the Project. The Table for CNEL Calculations and Normalization Methods shows that for a community located remote from cities and from industrial activity and trucking an adjustment of +10 dB is required. Although there is some noise associated with Highway 8 traffic, the Project will			expressed as a 365-day average.
be introducing more truck traffic from operation of the cement and rock crushing facility located in the Rugged Solar Project that will be on local roads and that may not follow a diurnal pattern. Just as there is no analysis of the impact of this additional traffic in the EIR Noise impact assessment the study also failed to consider these new noise sources that were not part of the pre-Project soundscape.	O21-10		Please note this methodology does not include factors to address tonality or impulsiveness of noise sources.
The CNEL table indicates that an adjustment of 10 dB is appropriate for a new noise source that is located in a community that was previously not subject to its noise. As seen in Figure 1, the EIR did not include this adjustment in the CNEL calculations.		O21-10	Refer to the response to comment O21-9. In addition,
DEFICIENCY 4-CNEL ANALYSIS IN EIR DOES NOT ACCOUNT FOR PREVIOUS EXPOSURE AND COMMUNITY ATTITUDES	Ť		
As in the previous two deficiencies, the Soitec EIR and its noise studies, Appendices 2.6-1 and 2.6-2 also fails to account for another of the CNEL adjustments. The community that will host the Project has no prior experience with noise of the type that will be produced by the solar array equipment, supporting maintenance functions, and associated new industry related to the concrete facility located in the project footprint.	O21-11		the noise analysis considered construction related traffic noise; see Section 2.6.3.2.
The CNEL adjustment to account for no prior exposure of 5 dB should be included.	1	021-11	Refer to the response to comment O21-9.
DEFICIENCY 5-THE COMBINED EFFECT OF THE THREE ADJUSTMENTS IDENTIFIED ABOVE RESULT AN ERROR OF UP TO 20	Ĩ	021-11	Refer to the response to comment 021-7.
DB IN THE EIR		001.10	
The Project as portrayed in the Soitec EIR and Appendices is at most marginally compatible with the host community. As shown above the analysis conducted for Soitec failed to include a number of adjustments for the CNEL and also did not include a full and proper disclosure and analysis of the spectrum shape of the noise source's emissions. Thus, the conclusions that the Project would be compatible with the local host community is not based on a full and complete analysis of the impact of the Project's noise emissions.	O21-12	O21-12	As explained in the response to comment O21-9, the County guidelines for noise assessment do not incorporate the methodology prescribed by the
DEFICIENCY 6-THE EIR DOES NOT INCLUDE ANY ANALYSIS OF THE IMPACT OF THE PROJECT ON WILDLIFE IN THE PROJECT	Ī		referenced EPA document (NTID300.3, Community
FOOTPRINT OR TO RECREATIONAL VISITORS TO AREAS ADJACENT THE PROJECT'S FOOTPRINT The EIR and Appendices fail to address the impact of the proposed project's noise emissions on	O21-13		•
wildlife. The lack of specific information about the operation of the solar array noise sources and the cement and rock crushing facility makes it impossible for an independent reviewer to conduct the analysis.			Noise, 1971). The CNEL calculations and conclusions in the DPEIR are compliant with current standards and
DEFICIENCY 7-THE FAILURE TO INCLUDE THE ISSUES PRESENTED IN DEFICIENCIES 1-5 PRESENTS A DISTORTED AND	Ī		1
INCOMPLETE ANALYSIS OF THE PROJECT			adopted thresholds of the County.
The Project developer should be required to submit a full and complete PDEIS that considers all of the aspects of the noises that will be emitted and to include the correct adjustments for the CNEL analysis. This analysis should also be required to include sufficient information describing the frequency and time domain characteristics of each noise source so that a proper independent review	O21-14	O21-13	Noise impacts on wildlife resources were addressed in
may be conducted.	1		the DPEIR under Chapter 2.3, Biological Resources.
MITIGATION OPTIONS	Ī		
If the Project is constructed the impact on the adjacent community can be mitigated by means of a noise barrier located around the perimeter where it abuts a residential community. The type of barrier that would be appropriate would be one similar to the highway noise barriers constructed of concrete slabs and I-beams for support. This type of barrier should be sufficient to provide	O21-15		Contrary to the comment's assertion, detailed information is provided on the operation of the solar
	*		array noise sources and the rock crushing batch plant
			in DPEIR Sections 2.6.3.1 (Operational Noise) and
			• •
			2.6.3.2 (Construction Noise).

The noise analysis follows, and includes all the **O21-14** prescribed content from, the adopted County guidelines for noise assessment. In this regard, the Noise section of the DPEIR presents a complete evaluation of all Proposed Project noise effects. Frequency spectrum analysis is not required by the County guidelines, and is not common for environmental noise assessments unless a unique portion of the spectrum shows potential known concerns such as with a wind energy project, where nearly all of the sound emissions occur in the low or frequency range. requested ultra-low The "adjustments" to the CNEL calculation based on a 1971 EPA publication are not necessary as the project is consistent with the County guidelines assessment for Noise Element conformance.

O21-15 The mitigation option identified is not necessary; the mitigation measures prescribed in the DPEIR consisting of equipment setbacks and noise enclosure requirements would reduce potentially significant operational noise impacts to less-than-significant levels.

O21-16 The County does not agree that the DPEIR is deficient. In conformance with CEQA, the DPEIR evaluated the whole of the action and analyzed each environmental subject area with regard to potential adverse effects, as well as a reasonable range of alternatives. The DPEIR is consistent with the

E-Coustic Solutions

SUBJECT: COMMENTS ON SOITEC SOLAR DEVELOPMENT DPEIR

PAGE 4 MARCH 3, 2014

protection for the homes closed to the Project equipment and is relatively easy to construct. If there is a need for openings along the perimeter to allow wildlife access across the project area the noise barriers can be laid out in a manner to have sections that overlap leaving an opening for egress while the overlap blocks the noise from the Project escaping into the adjacent community. Design of this type of barrier to accomplish the necessary attenuation will require the spectral information about the noise sources, but is well understood because of the broad use in highway noise control. There should be no problem in designing a barrier that can attenuate the sounds across the perimeter by 10 to 15 dBA.

Costs for constructing this type of barrier are lower than those associated with pre-fabricated acoustical walls and the durability is better. If the concrete and rock crushing operation was to be used to form the concrete slabs that form the barrier's walls the total cost will likely be considerably less than if the concrete slabs were purchased from a separate supplier.

CONCLUSION

The PDEIS should be rejected based on the Deficiencies 1 to 7. Had the proper adjustments been applied to the CNEL analysis the Project would not be acceptable. The Project developer should be required to conduct a full analysis that considers all of the characteristics of the noise sources, properly applies the CNEL adjustments, and includes sufficient data regarding the sound emission spectrum of each noise source, tones, impulses, such that independent reviews may be conducted.

As the PDEIS now stands it is not possible to rule out noise problems related to special frequency characteristics of noise sources, such as infra and low frequency sound, peak levels and the frequency of impulsive sounds from rock crushing, pile driving, etc.. Failure to include this information results in an EIR that distorts the analysis and conclusions that may be drawn from the documents. It precludes a full and accurate analysis of the Project's noise impact and identification of alternatives or mitigation measures. It also precludes a full and independent review.

Sincerely, E-Coustic Solutions

Richard R James no
